HEALTH TALK
JULY 2015
TOPIC: Fasting and Your Health
(Continued from June 2015)

Allow your seat belt remain fastened and continue the cruise.......

6. Breaking the Fast
Give special attention to the breaking of a fast. Do so slowly, easing back into regular foods (but making better choices about which foods!). Again, the length and intensity of the fast performed will dictate how many days you take to re-acclimate your body to regular eating.

7. Benefits of Fasting
When we fast, the body becomes lighter, more flexible; the mind becomes clearer and more creative. Greater intuitive powers may develop and deep spiritual insights may be experienced.

A fruit fast, like any of the fasting methods, will create an environment for your body to heal.

Toxins stored in the tissues will have an opportunity to be flushed out.

8. **Effects of fasting**
   a. Loss of appetite
   b. Heartburn
   c. Headache
   d. Dehydration
   e. Constipation
   f. Stress/fatigue
   g. dizziness
   h. Weight loss
   i. Reduced muscle tone
   j. Fruity-smelling breath
   k. Ketosis/ketone breathe-The process of ketosis is one of the physiological effects of fasting in which the brain (and some other bodily processes) uses ketones produced from fatty tissues as a fuel instead of the usual glucose. This is called "muscle sparing". It is said this state is attained at approximately 48 hours of a water fast for women and closer to 72 hours for men.
9. **Those who should not fast**
   a. Pregnant and nursing mothers
   b. Some Children depending on age and duration of fast.
   c. Certain medical conditions.
      i. liver or kidney weakness or disease
      ii. extremely frail, malnourished, anemic, or exhausted
      iii. weakened immune system
      iv. severely high blood pressure,
      v. medication-dependent diabetes
      vi. weak circulation causing frequent fainting.
   d. **Eating disorders.** Such as anorexia.
   e. After surgery or a major illness.
   f. **Anyone who is afraid of fasting.** Fear does not put you in the proper frame of mind for fasting and can lead to an unpleasant experience. Strong emotions, such as fear, are known to alter the body’s physiological processes. It can shut down certain bodily functions. It also is a closed emotional state. Instead, someone embarking on a fast should be relaxed and confident, and feeling open to the positive changes fasting creates.

10. **When to break fast**
    Fasting for long periods can have serious health effects. When hunger suddenly returns after being absent for perhaps days, it’s the sign the body now requires additional fuel. It is time to break the fast.

11. **Cross examination**
    Almost every physical problem (other than accidents) is caused by improper diet and lifestyle.

12. **Conclusion**
    Fasting is a personal journey -- you are not competing with anyone. Your body dictates how long you can safely fast, not your head.
